

Commonly Used Transimpedance Amplifiers

Overview

There are several different configurations of transimpedance amplifiers, each suited to a particular application. The one factor they all have in common is the requirement to convert the low-level current of a sensor to a voltage. Overview In, a transimpedance amplifier (TIA) is a to converter, almost exclusively implemented with one or more (opamps). The TIA can be used to amplify the current output of In the circuit shown in Figure 1, a sensor (represented as a current source) such as a photodiode is connected between ground and the inverting input of the opamp. The other input of the opamp is also connected to ground. The frequency response of a transimpedance amplifier is inversely proportional to the gain set by the feedback resistor. The sensors which transimpedance amplifiers are used with usually hav.
