

DC busbar grounding fault

Overview

Since the front end of these DC:DC converters have a filter stage with large capacitors tied to building ground for their input filtering, a fault in the DC:DC converter's filter can cause a ground fault or at least an imbalance to the DC bus voltage to ground. If an AC line cable connects to ground, current flows through the protective devices and disconnects the power protecting the cable. If one of the DC. lished from one polarity of the dc system to ground. The stationary battery and dc bus link of an uninterruptible power supply (UPS) used in many mission critical applications will often be grounded as the result of no or very poor isolation of the line (phas) to grounded neutral ac input to the. DC Earth fault needs to identify and remove as early as possible to avoid tripping of protection circuits. Please give me some information why we need to make this grounding connection on negative buspar.
