

Do liquid-cooled servers need optical modules

Overview

A liquid-cooled optical module helps move data fast and stay cool. It has a design that lets liquid flow inside or around it. These modules work best where normal cooling does not help, like big data centers or powerful computers. Liquid cooling technology, leveraging its higher thermal conductivity efficiency and energy-saving advantages, has been introduced into the optical module field, becoming a key direction for addressing the bottleneck of high-power heat dissipation. Technical Research & Analysis 2. This article provides an in-depth analysis of how, under extreme 400W heat density, the perfect synergy. Optical transceivers are now more than ever a critical component for data centers as they become key to reliable transmission of data across fiber optic networks. Servers don't operate in isolation — they need to communicate with each other in clusters via fiber optic links to.
