

Fiber optic switch configuration takes effect

Overview

After configuring interface split or merge on an interface, you need to save the configuration and restart the switch to make the configuration take effect. Fiber optics is a data transmission technology that uses glass or plastic strands to send light signals over long distances. Cisco switches are devices that connect multiple network devices and enable data transfer between them. Configuring fiber optics on a Cisco switch may seem complicated, but. This document describes how to troubleshoot fiber optic interfaces by addressing some of the fiber optic module and cabling specifications. There are no specific requirements for this document. They are used in a wide range of applications, including telecommunications, data centers, industrial automation, and military and aerospace. This guide will walk you through diagnosing and resolving common.
