

High and Low Temperature Cyclic Test of Optical Module

Overview

During the temperature cycling test (TCT), semiconductor packages are exposed to extremely low and extremely high temperatures commonly for 1000 cycles. It realizes the conversion between optical signals and electrical signals, allowing data to be transmitted through optical fibers at higher speeds and longer distances. A mechanical failure resulting from. AEC documents are designed to serve the automotive electronics industry through eliminating misunderstandings between manufacturers and purchasers, facilitating interchangeability and improvement of products, and assisting the purchaser in selecting and obtaining with minimum delay the proper. IEC 60068 is an international standard that specifies various environmental testing procedures for evaluating the reliability of equipment. It includes a range of tests designed to simulate different climatic and mechanical stresses, helping manufacturers ensure their products can withstand. Fiber Optic Transceiver manufacturers test these devices to assure optical transceivers circuits work at certain temperatures.
