Overview

In addition to providing the highest bandwidth, the IQS series Coherent Optical Receivers have pristine signal fidelity. Using precision measurements, the entire electrical signal path from the coherent receiver input to the osc. In addition to providing the highest bandwidth, the IQS series Coherent Optical Receivers have pristine signal fidelity. Using precision measurements, the entire electrical signal path from the coherent receiver input to the oscilloscope input is de-embedded. A dynamic self-calibration between the IQS receiver and the oscilloscope enables field d. The Teledyne LeCroy IQS Coherent Optical Receivers leverage a system architecture that allows pairing of the coherent optical receiver with any compatible Teledyne LeCroy oscilloscope without any factory calibration. All required calibrations are built into Coherent Receiver and performed at the time of measurement. This architecture also enables t. The amplitude and phase measurement capabilities of OpticalLinQ enable detailed component testing. It is now possible to directly measure the effects of a single component on the phase of the electric field. Common applications and measurements include: Modulator research and development Modulator chirp measurements Dispersion measurements for. OpticalLinQ offers both quick and convenient BER Estimates along with true and accurate BER counting capabilities. The BER set up panel allows you to configure the coding scheme from one of the common pre-set options, or define your own custom bit sequence and multiplex options. Understanding system performance along the optical link or at the receiver itself is essential to determine the performance of the phase modulated signals. Users can enter fiber-based values for compensation of chromatic dispersion (CD). Common applications and measurements include: State of Polarization versus time Total Link Dispersion.
