

Outdoor cabinet temperature too high

Overview

Cabinetry: Metal cabinets can become extremely hot in direct sunlight. Choose lighter colors or consider materials like treated wood or composite that don't absorb as much heat. Providing ample shade for outdoor kitchen areas is one of the most effective ways to combat. Between solar radiation pounding down on cabinet surfaces, internal electronics adding their own thermal loads, and ambient temperature jumping from colder-than-anything winter to hotter-than-ever summer, the phenomena that threaten overheating are tangible—and costly. The sun's UV rays fade colors and weaken surfaces. Bad weather can ruin them fast without proper care. Whether you're dealing with the moisture-heavy air of coastal areas or the dry heat of desert climates, your beautiful kitchen and bathroom cabinets face constant environmental. Nearly 7 in 10 backyard chefs say they wish they'd taken a key step before their first grill season. Smart protection makes your outdoor space a year-round.
