

## Relay protection input verification

### Overview

Relay inputs are verified over the specified ranges. Protection relay output contacts are type tested to make sure that they follow product. The testing and verification of relay protection devices can be divided into four groups: Type tests are needed to prove that a protection relay meets the claimed specification and follows all relevant standards. Since the basic function of a protection relay is to correctly function under abnormal. Verify that your protection relays operate correctly when faults occur. Megger's smart relay testing solutions and expert support help you validate protection performance, improve system reliability, and ensure continuity of power across your network. Ensure protection systems operate correctly. All relevant I/O's associated with each protective element need to be accounted for during the testing process. Both sides of the logic equation should also be tested. This SWP should be interpreted in conjunction with Standard for Substation Protection (V1).
