

Shortwave Communication Tower

Overview

Radio masts and towers are typically tall structures designed to support antennas for telecommunications and broadcasting, including television. There are two main types: guyed and self-supporting structures. They are among the tallest human-made structures. Masts are often named after the broadcasting organizations that originally built them or currently use them. A mast radiator is a type of antenna. Terminology The terms "mast" and "tower" are often used interchangeably. However, in structural engineering terms, a tower is a self-supporting structure, while a mast is held up by stays or guy wires. A mast is a structure that is supported by guy wires. The first experiments in radio were conducted by Guglielmo Marconi beginning in 1894. In 1895–1896 he invented the radio, which was initially a wireless telegraph. The steel lattice is the most widespread form of construction. It provides great strength, low weight and wind resistance, and economy in the use of materials. Lattices of triangular cross-section are most common, a
