

What liquid is inside the cold-joint

Overview

The formation of a cold joint is governed by the hydration process, where cement chemically reacts with water, causing the mix to transition from a plastic state to a solid state. A cold joint in concrete construction is a plane of weakness that forms when new, wet concrete is poured against concrete that has already begun to harden. This discontinuity occurs because the older material has passed its initial setting time, preventing a true chemical bond with the fresh mix. Hail can damage aircraft, homes and cars, and can be deadly to livestock and people. What we do: Read more about NSSL's hail research [here](#). This article explains why surface caulk often fails and what better repair approaches look like for DIY work. Identify leaks by looking for damp patches. However, as RCC is a mixture and it is made and laid in batches, cold form joints are a common occurrence. Today, in this blog, we shall discuss cold joints in concrete. What are Cold Joints in Concrete?

Cold joints are the weak spots in the RCC structural members caused by a lack of proper bonding.

Cold Joints Explained

Cold joint cracks and gaps often respond well to high-pressure epoxy injection, which can fill the voids and strengthen the bond, restoring much of the original concrete strength.

What is a Cold Joint in Concrete? (And How to Fix them!)

Cold joints occur when a fresh concrete batch is poured against a partially hardened existing layer. As you know, concrete hardens through chemical reactions between cement aggregate, water, and air.
