Having a PDU is not always necessary, but it can provide additional power distribution and monitoring capabilities in a data center or server room. Depending on the specific requirements and setup, a PDU can be a useful addition alongside a UPS system. A power distribution unit (PDU) is a device used to control electrical power in a data center. It functions as a large power strip without surge protection, providing standard electrical outlets for data center equipment. However, basic PDUs do not offer monitoring or remote access capabilities. A power strip is a common example of a basic power distribution unit (PDU). It allows multiple devices to be powered using a single power source, such as a wall outlet. Modern PDU units can also provide additional features like equipment, environmental, and power monitoring. Yes, each PDU input cord is connected to an independent UPS, utility, or generator power source. The PDU then distributes power to equipment with redundant power supplies, ensuring each power supply has an independent power source. A PDU typically connects to a power source, receiving power from either a single-phase or three-phase power source. It provides power to multiple devices through its outlets, which can be configured as C13, C19, or other types depending on the equipment being powered.
